

This is the HelloWorld.html file on the browser.

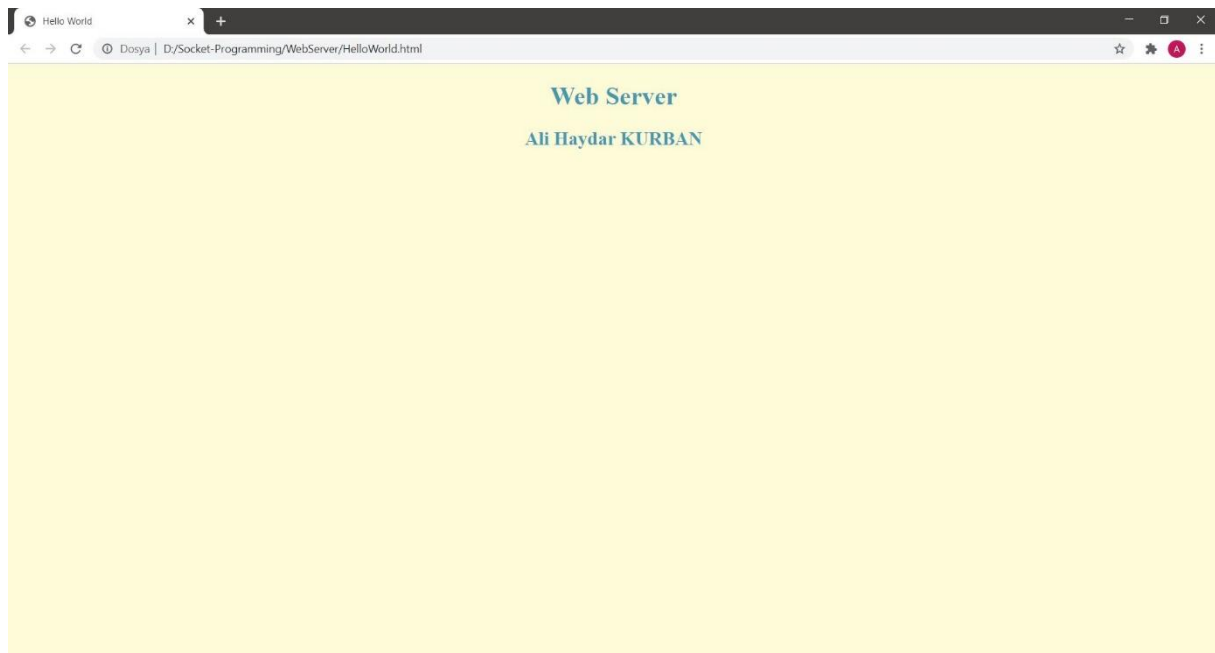

Figure 1

Runing WebServer.py on the terminal.

```
C:\Windows\System32\cmd.exe - py -2 WebServer.py
Microsoft Windows [Version 10.0.18363.1379]
(c) 2019 Microsoft Corporation. Tüm hakları saklıdır.

D:\Socket-Programming\WebServer>py -2 WebServer.py
IPv4 Address = 
Port Number = 6789
Example Usage = :6789/HelloWorld.html
Ready to serve...
```

Figure 2

Copy the 'Example Usage' which is output of the WebServer.py on the terminal, and past the URL to a browser on a host (Computer).

You can see the same html page with the above image (Figure 1).

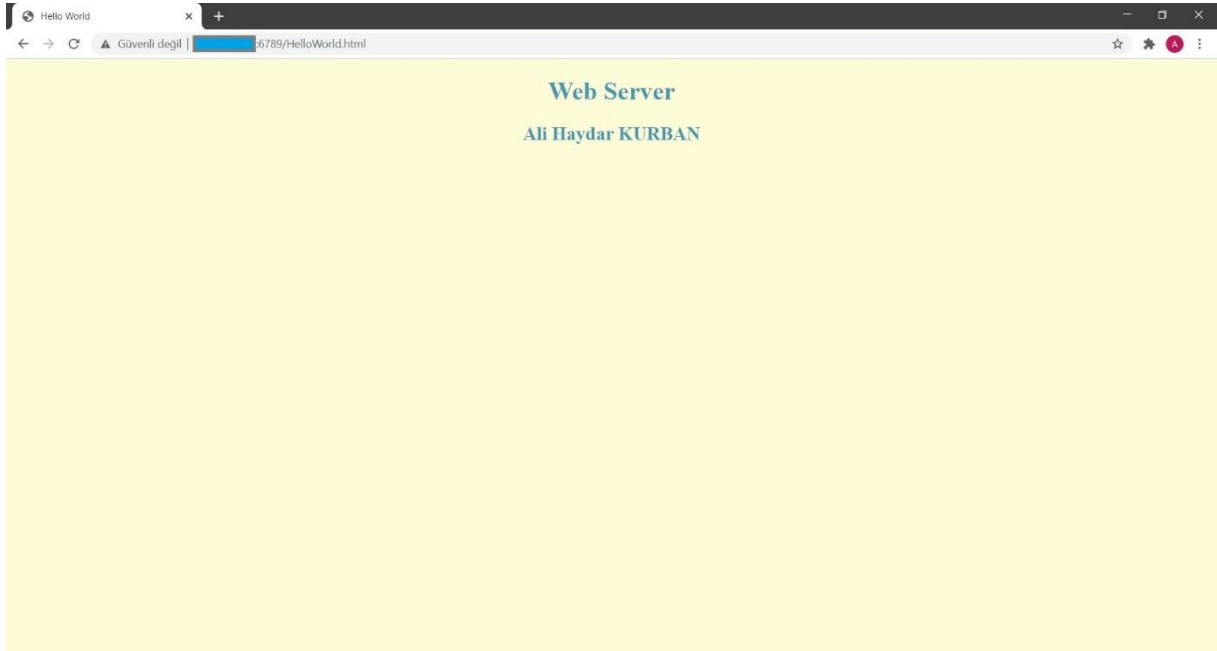

Figure 3

Change the file name in the URL. There is not such a file in the same directory with the WebServer.py

You can see the 'HTTP ERROR 404' page not found error. (Host is Computer)

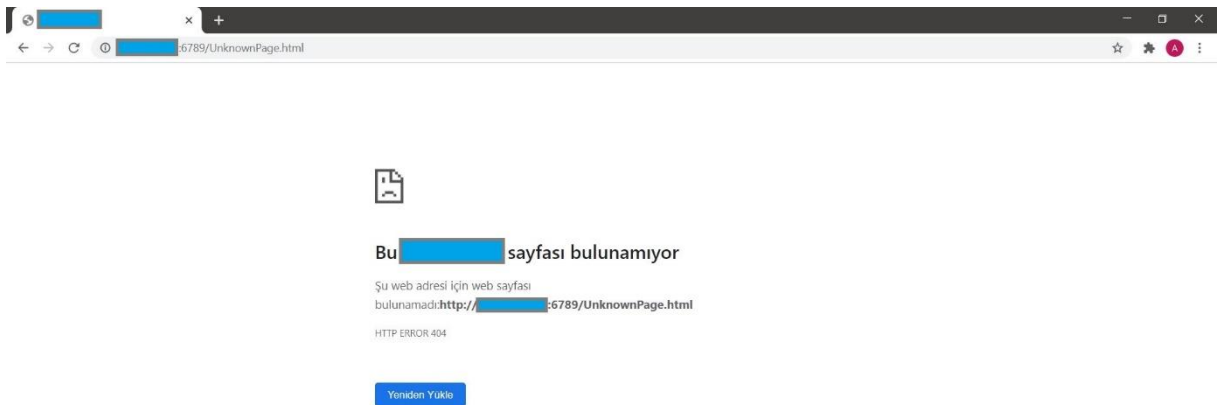

Figure 4

Use the same URL on a different host (Phone).

You can see the same html page with the above image (Figure 1).

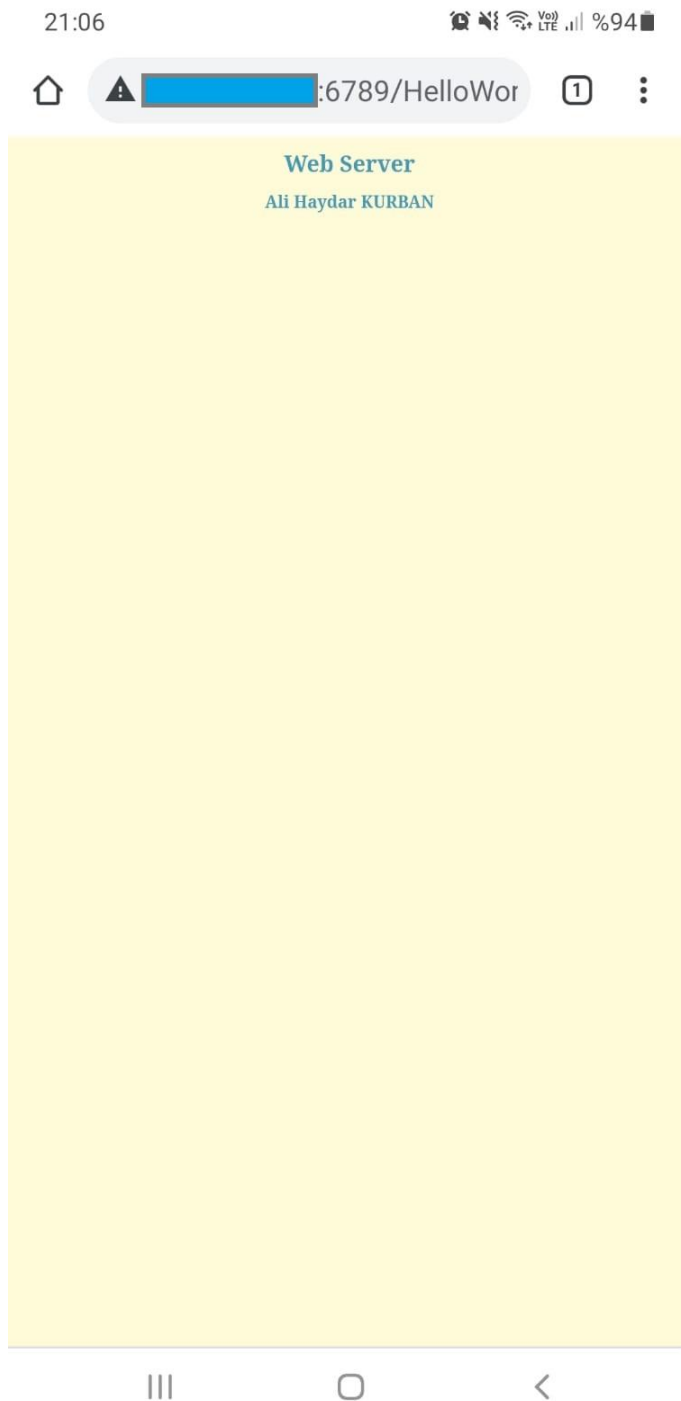

Figure 5

Change the file name in the URL. There is not such a file in the same directory with the WebServer.py

You can see the 'HTTP ERROR 404' page not found error. (Host is Phone)
